SUMMARY

Informatik student (B.Sc., German-Jordanian University, graduating May 2027) who builds mobile and web apps with Kotlin and Jetpack Compose, Flutter, and React with TypeScript. I use LLMs only where they measurably improve a user outcome, and I treat model output as untrusted input. Starting a Pflichtpraktikum at Mercedes-Benz AG in October 2026 and open to full-time roles from May or June 2027. Outside software I have worked as a barista and run two small businesses.

EXPERIENCE

Drone Control App Development (Pflichtpraktikum), Mercedes-Benz AG, Stuttgart

From Oct 2026

- Project topic: developing an app to control and operate drones in a production environment.

Software Development Intern, GCESoft, Amman, Jordan

Summers 2022, 2023, 2024

- Shipped Android features and production fixes for the Van Sales and POS apps connected to the company ERP.
- Built barcode-scanner workflows on M3 Mobile handhelds for the Stock Taking and Fixed Assets modules.
- Automated ERP data cleanup with Python scripts.
- Took part in daily standups, handed builds to QA, and supported clients in Arabic and English.

PROJECTS

Life OS, personal life manager (sole developer)

2026 to Present

- Built a Flutter and Supabase app end to end: product, architecture, client, Postgres schema, security model and AI layer.
- Integrated the Gmail API to track job applications through a 5-stage pipeline, along with tasks and subscriptions.
- Wrote three server-side Supabase Edge Functions that call an LLM (GPT-OSS 120B on Groq, chosen for cost). Every model response is parsed and validated before it touches the database.
- Assembled the daily brief in code from the user's own data, with no model involved, so it cannot hallucinate.
- Secured data with Postgres Row Level Security plus table grants, and added document storage with search by description.

Stack: Flutter, Dart, Supabase, PostgreSQL, Edge Functions, Gmail API

LAZ Store, Android app for my online car parts business in Jordan

2024 to 2026

- Rebuilt the business as a bilingual (Arabic and English) Android app with separate interfaces for customers, employees and admins.
- Built photo search: a customer photographs a part they can't name and gets AI matches (Claude or GPT-4 via OpenRouter) limited to parts actually in stock, followed by a chat for questions.
- Implemented inventory, orders, returns, sales analytics and real-time cart sync.

Stack: Kotlin, Jetpack Compose, Firebase

The Lab, project showcase at lab.zaidj.tech

2026 to Present

- Built a site where each of my projects runs as a live interactive demo in the browser.
- Structured it as a pnpm monorepo with Astro 5 and React in strict TypeScript, styled with Tailwind CSS v4 and tested with Vitest.
- Deploy with GitHub Actions to a VPS. The pipeline fails if a demo's logic drifts from the real app's code.

Stack: Astro, React, TypeScript, Tailwind CSS, Vitest, GitHub Actions

EDUCATION

B.Sc. Informatik, German-Jordanian University, Amman, Jordan

Sep 2021 to May 2027 (expected)

Exchange semester, HTW Saarland, Saarbrücken

From Mar 2026

Focus: mobile computing, AI, algorithms.

SKILLS

Mobile: Kotlin, Jetpack Compose, Android, Coroutines, Material 3, Flutter, Dart

Web: TypeScript, JavaScript, React, Next.js, Astro, Node.js

Backend and data: Firebase, Supabase, PostgreSQL, REST APIs, Python

Tools and AI: Git, GitHub Actions, LLM integration

LANGUAGES

Arabic: native | English: C1 | German: B2 (telc)
